### Indole derivatives as 5-HT receptor antagonist

This invention relates to compounds having pharmacological activity, processes for their preparation, to compositions containing them and to their use in  
 5 the treatment of CNS disorders.

WO 94/04533 (SmithKline Beecham plc) describes indole and indoline derivatives which are described as possessing 5HT<sub>2C</sub> receptor antagonist activity. A structurally distinct class of compounds has now been discovered, which have been found to have 5HT<sub>2C</sub> receptor antagonist activity. Certain compounds of the  
 10 invention also exhibit 5HT<sub>2B</sub> antagonist activity. 5HT<sub>2C/2B</sub> receptor antagonists are believed to be of potential use in the treatment of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines,  
 15 schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

5 Certain compounds of formula (I) are capable of existing in stereoisomeric forms including enantiomers and the invention extends to each of these stereoisomeric forms and to mixtures thereof including racemates. The different stereoisomeric forms may be separated one from the other by the usual methods, or any given isomer may be obtained by stereospecific or asymmetric synthesis. The invention also extends to any tautomeric forms and mixtures thereof.

10 The present invention also provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof, which process comprises:

(a) the coupling of a compound of formula (II);

15

(II)

with a compound of formula (III);

20  $\text{D}-\text{R}^4'$  (III)

wherein A,  $\text{P}^1$  and  $\text{P}^2$  are as defined in formula (I), C and D contain the appropriate functional group(s) necessary to form the moiety  $-\text{NR}^3'\text{CO}$  when coupled, the variables  $\text{R}^1'$ ,  $\text{R}^2'$ ,  $\text{R}^3'$  and  $\text{R}^4'$  are  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$  respectively, as defined in formula (I), or groups convertible thereto, and thereafter optionally and as necessary and in any appropriate order, converting any  $\text{R}^1'$ ,  $\text{R}^2'$ ,  $\text{R}^3'$  and  $\text{R}^4'$ , when other than  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$  respectively to  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$ , interconverting  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$  and forming a pharmaceutically acceptable salt thereof; or

25 (b) the coupling of a compound of formula (IV);

30

(IV)

35 with a compound of formula (V);

5 wherein  $P^1$ ,  $P^2$ ,  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  are as defined above and E and G contain the appropriate functional group(s) necessary to form the A moiety when coupled and thereafter optionally and as necessary and in any appropriate order, converting any  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$ , when other than  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  respectively to  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$ , interconverting  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  and forming a pharmaceutically acceptable salt.

Suitable examples of groups C and D include:

- (i) C is  $-N=C=O$  and D is hydrogen,
- (ii) C is  $-NR^3'COL$  and D is hydrogen,
- (iii) C is  $-NHR^3'$  and D is COL, or

15 (iv) C is halogen and D is  $-CONHR^3'$

wherein  $R^3'$  is as defined above and L is a leaving group. Examples of suitable leaving groups L include halogen such as chloro, bromo, imidazole, phenoxy or phenylthio optionally substituted, for example, with halogen.

20 Suitable examples of a group  $R^2$ ' which are convertible to  $R^2$ , include alkoxy carbonyl and benzyloxy or *para*-methoxybenzyloxy which are converted to the group where  $R^2$  is hydroxy using conventional conditions.

25 Interconversions of  $R^1$ ,  $R^2$  and  $R^3$  are carried out by conventional procedures. For example  $R^1$  halo can be introduced by selective halogenation of the ring  $P^1$  using conventional conditions. It should be appreciated that it may be necessary to protect any  $R^1$  to  $R^3$  hydrogen variables which are not required to be interconverted.

Suitable protecting groups and methods for their attachment and removal are conventional in the art of organic chemistry, such as those described in Greene T.W. 'Protective groups in organic synthesis' New York, Wiley (1981).

30 Compounds of formula (II) and (III) may be prepared according to known methods or analogous to known methods, for example using the procedures described in WO 95/01976. Compounds of formula (II) in which C is  $NH_2$ ,  $NO_2$  or  $CO_2H$  can be prepared by reacting a compound of formula (VI) with a compound of formula (VII):

in which  $R^1$ ,  $R^2$ ,  $P^1$  and  $P^2$  are as defined in formula (II) and T and Q contain the appropriate functional groups necessary to form the A group. For example

- a) when A is a bond, one of T and Q is  $B(OH)_2$  or  $Sn(Bu)_3$ , and the other is halogen or OTf (see for example *Adv. Het. Chem.* 1995, **62**, 306).

b) when A is a chain, one of T and Q is an acid chloride and the other is amino, or one of T and Q is hydroxy and the other is chloro or chloromethyl; or

c) when A is a heterocyclic ring, one of T and Q is a thioamide group and the other is  $BrCH_2C=O$ .

Compounds of formula (III) may be prepared according to known methods or analogous to known methods, for example

- 15      a) from the appropriate aniline via indole formation (Nordlander [JOC, 1981, 778] or Sundberg [JOC 1984, 249] routes) followed by reduction of the indole ring using sodium cyanoborohydride. It will be appreciated that in certain cases a mixture of indoles will be formed which can be separated at this stage or at a later stage.

20      b) from the appropriate ortho-methyl nitrobenzene via indole formation (Leimgruber procedure Org Syn Coll vol VII, p34) followed by reduction of the indole ring.

25      c) by aromatic substitution of a suitably protected indole/indoline precursor, for example alkylthio groups maybe introduced by thiocyanation of the indoline ring followed by hydrolysis and alkylation, or

25      d) From the appropriate nitrobenzene via indole formation by aromatic nucleophilic substitution (J.Med. Chem. 1990, 2089) followed by reduction of the indole using  $\text{NaCNBH}_3$ .

Novel intermediates of formula (III) also form part of the invention.

Suitable examples of reactions of compounds of formulae (IV) and (V) are

- 30 those where E and G are the same as T and Q respectively in compounds of formulae (VI) and (VII) above. Compounds of formula (IV) are commercially available or can be prepared using standard procedures. Compounds of formula (V) can be prepared using standard procedures such as those outlined in WO 94/04533 or WO 95/01976.

Pharmaceutically acceptable salts may be prepared conventionally by reaction with the appropriate acid or acid derivative. N-oxides may be formed conventionally by reaction with hydrogen peroxide or percarboxylic acids.

Compounds of formula (I) and their pharmaceutically acceptable salts have 5 SHT<sub>2B/2C</sub> receptor antagonist activity and are believed to be of potential use for the treatment or prophylaxis of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also 10 disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

Thus the invention also provides a compound of formula (I) or a 15 pharmaceutically acceptable salt thereof, for use as a therapeutic substance, in particular in the treatment or prophylaxis of the above disorders.

The invention further provides a method of treatment or prophylaxis of the above disorders, in mammals including humans, which comprises administering to the sufferer a therapeutically effective amount of a compound of formula (I) or a 20 pharmaceutically acceptable salt thereof.

In another aspect, the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for the treatment or prophylaxis of the above disorders.

The present invention also provides a pharmaceutical composition, which 25 comprises a compound of formula (I) or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form 30 of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusible solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tabletting 35 lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry

product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if desired, conventional flavourings or colourants.

5       For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be dissolved for injection and filter sterilised before filling into a suitable vial or  
10      ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is suspended in the vehicle instead of being  
15      dissolved, and sterilization cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

The composition may contain from 0.1% to 99% by weight, preferably from  
20      10 to 60% by weight, of the active material, depending on the method of administration.

The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight of the sufferer, and other similar factors. However, as a general guide suitable unit  
25      doses may be 0.05 to 1000 mg, more suitably 0.05 to 20.0 mg, for example 0.2 to 5 mg; and such unit doses may be administered more than once a day, for example two or three a day, so that the total daily dosage is in the range of about 0.5 to 100 mg; and such therapy may extend for a number of weeks or months.

When administered in accordance with the invention, no unacceptable  
30      toxicological effects are expected with the compounds of the invention.

## **INTERNATIONAL SEARCH REPORT**

Serial number or application No.

PCT/EP 96/00368

**Box 1** Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
  2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
Claims 1-4,6-8-10 are so broad that a complete search was not possible for economical reasons. Only a few examples of novelty destroying documents have been cited in the search report.
  
  3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II. Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
  2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protarg

- The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
